

## From The Staff:

WTFDA Headquarters, P.O. Box 97, Calumet City, IL 60409

**ASTOUNDING P2 DX HAUL...** We've just received word, via New York DXer Jerry Fulice, of some super DX. During an unusually good mid-November E-skip opening in North America, 45 MHz New Zealand ch 1 video was detected by Massachusetts DXer Bill Devent. Along with 46 MHz Australian video, these signals represent perhaps the ultimate in long haul DX to North American DXers. Australian video has been seen in Texas in the recent past, so as some DXers expected, Sunspot Cycle 21 is still full of surprises. The New Zealand video signals undoubtedly made it to Massachusetts via a combination of P2 and E-skip. We'll have more info in upcoming WUDs. In the meantime, congratulations are in order to those lucky DXers who equipped themselves for foreign standard TV signals!

**IT'S OKLAHOMA CITY IN '81...** Oklahoma City DXer John Zondio has submitted the only bid for the 1981 WTFDA Convention. Tentative dates for the event will be July 31, August 1, and August 2, 1981. More information will appear in the WUD in the next few months; in the meantime, when you think of next summer, remember to include Oklahoma in your travel plans. This will be the one you won't want to miss.

**NEW EDITOR NEEDED...** We're now in need of a new editor for the EASTERN TV DX column. Good typing abilities, as well as a typewriter in good working condition, will be required for anyone who'd like to volunteer. If you are an avid DXer willing to take on the responsibility of doing a regular DX column for the WUD, this is your chance to help the club. Contact Bill Thompson (address on back cover) if interested. In the meantime, our thanks are due to Robert Kramer for his work as EDX editor.

**WTFDA SUPPLY PRICES TO INCREASE...** The coming year will see some club supplies increase in price, as inflation continues to be a very real problem. We're trying to hold the line as much as we can--be watching for some special supply offers in the coming months. An updated back cover this month details what's currently available.

## TABLE OF CONTENTS

HAILBOX: How WTFDA voted on recent ANARC matters.....	3
FCC FM NEWS: More Canadian FM news, via Walter Patton.....	6
EASTERN TV DX: New editor is needed.....	8
WESTERN TV DX: Pat Dyer's super summer E-skip, cont'd....	11
TECHNICAL TOPICS: More antenna questions.....	13
TV STATISTICS: The "Great 28".....	15
PHOTO NEWS: Heat shot of Topeka UHF via tropo.....	15
SOUTHERN FM DX: Summertime DX results go on.....	16
NORTHERN FM DX: Autumn tropo sinks to zero.....	20

Robert Foworth-GPO Box A-866-New York, NY 10116  
Mark Lucas-721 McKinley Ave.-Lancaster, OH 43130  
Jim Pizzi-P.O. Box 2493-Orcutt, CA 93455

### Renewals Due in January:

Robert E. Baxter, Roger Carrere, Randall Clark, Lawrence Crane, Ray Fraser, Mark Harms, Ed Houchins, Carlton Howington, Rod Luoma, W.H. McIntosh, Paul Mitschler, Ken Onyschuck, David Rogers, Robert Schweitzer, Paul Traska, Bob Umhoefer, Morgan Williams.

Our new member parade leads off this month with ROBERT DIXON. Robert is an electrical engineer and operates with the calls W8ERD.

The program director of WABE in Atlanta is one of our members now. He's FRED HOLLAND, who's into SSB, FM and TV DX, and belongs to NRC. Fred DXs with a Pioneer TX-1000 tuner.

MICHAEL TODD is primarily a shortwave DXer and belongs to NASWA and SPEEDX. His DX gear includes an RF-2200.

Finally, from the high school football capital of Ohio comes RICHARD TROYER. Richard's DX interests span SSB and TV, and he's a member of NRC. Equipment in his shack includes an RCA 25" color TV with a Channel Master VHF antenna and an indoor UHF antenna. He'd welcome your suggestions on what VHF and UHF antennas and preamps to use to improve his DX system.

### Tidbits.....

Here's the latest from Don Erickson on a pre-publication discount for the 1981 edition of the World Radio TV Handbook: "The 1981 WRTB will retail at \$17 in the USA. Orders are now being taken at \$15 per copy including UPS or book rate shipping of copies when received early in 1981. The deadline for orders is 10 December 1980 after which time the price will be \$17. Orders should contain check or money order payable to Donald Erickson. Please enclose a self-addressed, stamped envelope for confirmation of shipment. Canadians may enclose an unaddressed envelope with return address and should use only International Money Order or Canadian Postal Money Order payable in U.S. dollars. All orders should specify 1981 WRTB on the outside of the envelope and be mailed no later than December 10, 1980 to: Donald Erickson, 6009 Essex Street, Riverside, CA 92504. 1980 WRTB's are no longer in stock; they may still be ordered from Wilson-Guptill in Cincinnati. All orders are accepted with a guarantee of immediate refund at any time before shipment, without question. Inquiries welcome at 714-687-5910 until midnight PST."

This is from member Mike Koronka: "I am in the process of reconstructing my FM antenna system. I want to get it high in the air with a larger antenna. My present installation I have wired to the home stereo so right now I am left without an antenna for my DXing receiver. I had planned on doing it this summer, but just could never find the time."

A big welcome back is in order for Charles George! He updates us on what's been happening with himself: "I am unemployed at the moment; however, I have done volunteer work during pledge drives at KERA-TV and FM. I used to do volunteer announcing at KCHU (now KNOR). I did a DX show for KCHU. I am 27. I have the SWL call #DXSTOP. The other clubs I am in are NASWA, SPEEDX, NNSC, NRC, Association IX Del Litoral in Rosario, Argentina. I am interested in DXing whatever I can receive with my equipment. My DXing equipment is a Panasonic RF-2500, a CTR-43 Realistic cassette recorder, and an SCA adaptor from FM Atlas. For most of my FM DX so far I just use the built in whip, but sometimes use a 30' wire. I am a past member of WIFDA, but dropped out from not receiving DX, but this past year I received several stations. In July I picked up stations from Michigan, Indiana, Canada, Ohio and Pennsylvania. I also have a small broadcasting board I bought used for \$100, a Spotsmaster 4BEM50, four pots, eight inputs. I use it to practice my announcing/production techniques."

Now, a few words from old friend John Callahan: "I have been doing a bit of FM DXing this summer, though I missed the great E-skip opening that started on my birthday, June 18th. And, doggone it, my wife was out of town that week, too, so I could have spent all my spare time at the FM dials.

Did find a fairly interesting E-skip opening on July 17th when I woke up from my afternoon nap, with Quebec and New Mexico coming in simultaneously, plus Colorado and Utah, but I had to cut out short to travel to Nashville, Illinois, where the WMIK All-Stars were involved in a donkey race. Did continue to tape a few DX catches on the car radio on the way over. Most interesting.

My equipment at home continues to be as described previously, a Fisher 220 fed by a TV antenna frozen toward St. Louis at about 50' above ground, which is definitely not optimum for tropo.

I have taken advantage of a couple of off the air situations for WMIK and WDOD, two relatively impenetrable signals (well, with my setup, absolutely impenetrable), and was happy to get an opening into Kansas City (KCKN) during WMIK's couple of nights off and into Wichita (KARD) while WDOD was missing. KARD is my greatest distance on tropo, about 450 miles, so the really deep tropo that those with better facilities are getting hasn't hit my system yet. Best Class A tropo catch is WENW 92.1 at right at 300 miles from this site."

Last report this month comes from Dr. Richard Wood: "I have now installed a 106' Rohn tower with a quad array of four horizontally and vertically stacked Winegard FM antennas. Under average conditions I get 300-plus miles in all directions, e.g., Cincinnati, Indianapolis, Birmingham, Knoxville, Chattanooga, Hagerstown, Kansas City. I will be reporting to FM North regularly. When I can afford it, I will add a 10' homebow UHF dish and a VHF antenna to the system." Not bad, eh?

As many of you know, WIFDA's three representatives to ANARC are yours truly, Peter Oprisko and Morris Goldman. Recently, we cast several ballots which will be of interest to the membership:

1. Ballot for 1981 Convention- On this, the club voted in favor of Thunder Bay, Ontario, over St. Louis for the convention. We feel the convention committee in Thunder Bay is better able to put on the convention and showed their true interest in hosting by bidding for the 1980 convention.
2. Confirmation of ANARC Executive Secretary- There was no call for nominations in the ANARC Newsletter. Dave Browne says he was nominated by ASWLC, seconded by AIDX. The three of us voted against Dave Browne because of the failure to have the nominations called for.
3. Increase ANARC dues to 5¢ per member from the present \$2 per 100-. We voted against this, as for our club, it would represent 2½ times what we're now paying.
4. Increase ANARC Newsletter subscriptions to \$5 if postal rates go up January 1- We approved this one, with hopes the rates will go up regardless of a postage increase.
5. Approve site of following year's ANARC convention at ANARC conventions- We voted against this because we feel the club reps should have a say in where the convention will be held, rather than the persons attending the convention.
6. Approve sending a complementary copy of the bulletin to the ANARC Newsletter editor, rather than the Executive Secretary, unless both positions are held by one person- No problem approving this.

7. Amend the ANARC By-Laws to read that ANARC business should be taken care of as needed, at the Executive Secretary's discretion, but at least quarterly- We agree with Dave Browne's reasoning that urgent business should not wait for a quarterly vote, but should be dealt with as needed. Any questions or comments you have regarding ANARC business are most welcome, and will aid in future votes. See y'all next month.....73.....JZ

## STATION BREAK

c/o Bill Thompson  
1907 Seneca Street  
Buffalo, NY 14210

WIFDA member ads only. 3 line or 30 word limit.

TRADE - Recent TV GUIDEs from all U.S.A. points in return for Canadian ones (you specify area). Saul Chernos, 79 Ridge Drive, Toronto, Ontario M4T 1B6, CANADA.

FOR SALE - I have the VHF-UHF DIGEST issues from 1976 to 1979 for sale. Martin J. Theil, 12 Princeton Drive E., Holiday, Florida 33590.

FOR SALE - Sony ICP-3000W. Like new. Excellent condition. AC cord included. Price: \$75.00, bank draft please. UPS. Robert Heckendorn, Box 261, Yankton, SD 57078.

Your non-commercial ad can appear in the VUD free of charge! Got a piece of gear you'd like to sell? Looking for something? Advertise in STATION BREAK.

## IFCDX

You are invited to join one of the newest and most unique DX organizations in existence today--the International Fellowship of Christian DXers. We publish a monthly bulletin called Fellowship Calling, which features station profiles, SW DX loggings, QSL tips, inspirational thoughts, as well as many other sections dealing with all aspects of the DX hobby. We have established a QSL Bureau for those who have difficulty obtaining verifications of their reception reports and a correspondence department for those who wish to establish meaningful friendships with DXers around the world. The only requirements for joining the club are an interest in religious broadcasting and payment of the \$5 annual dues.

Please send any comments or suggestions you have to David Delatte, Route 2, Box 97B, Jackson, LA 70765.

## CADX GETTOGETHER

The longest continuous gettogether in the DX world will take place December 26th - 29th and the New Year's Eve Party/DXathon will be held at 4639 N. Albany in Chicago. This is the 11th edition; there will be several all night sessions on whatever band appears worthwhile, and station junk trading will be encouraged. For further info, contact Robert Kramer, 4639 N. Albany, Chicago, IL 60625. Telephone: (312) 463-4334.

# EASTERN TV-DX

Robert Kramer  
4639 N. Albany  
Chicago, IL 60625

DECEMBER 1980

Deadline: 5th

It is with regret that I announce my resignation as Eastern TV editor. I have had a good time doing the column, however, recently my work load has increased, making it impossible to continue. I will continue doing the column until someone else comes along. I would, for the good of the club, hope that someone will take over soon, as I will type up only the reports that I have time for. As a result, there will be several reports that won't get in this issue. I have 2 suggestions for you all out there. 1. Either revamp the boundaries for Eastern-Western TV or create a Central TV DX column. The work load for Eastern TV is so great that it would be hard to get it all done for some people. On the other hand, Western TV DX is usually only 2 or 3 pages. 2. Encourage reporters to not report an entire season's DX in one report. This results in the editor getting 10 or more pages (last month I would have had at least 14 if I had printed everything that came in).

WUAB-43 OH	0929 74 & 76 Ottumwa	*On March 7 I received my
1st lightning scatter ever-receiving WHTI-32 with ABC programming, WHTI-27 with CBS, WHEF with NBC, WHEF-41 T, & WHTI-41 T. Lightning scatter reception is very similar to scatter scatter. The best trope that I received to the southwest occurred on June 26 & 27, with Oklahoma City, Tulsa being received and perhaps even reaching Dallas early on the 26th. All VHF channels were jumbled during the evening of the 26th. The best trope to the east occurred on July 14 & 15 with Baltimore, Hershey, and Hagerstown coming through the oceans. On July 21, using phase nulling techniques, I was able to receive KHVI-6 Postello during their 10:00 newscast while phasing out local WOC-6. On August 27, super tropo opening occurred to the KMEC with WHEF-7 & WHEF-19 travelling the distance. At first all I could see on the KMEC color bar was the O at the end of Buffalo, and finally the signal level increased. WHEF's just about the farthest VHF that I have received. Finally, on August 28, I received WHTI-7 Detroit for the first time. Their early morning local news format is just like WIS, as both are ABC G & J. 73's Marv KAGNO."

Pat Dyer (continued)

July 1980

A strong surge of mid-late July Es. Again, for the most part, trop was a problem due to the CCI it gave the weaker Es openings, often making an MUF determination impossible. The intense openings of the 17th produced an almost 2-way contact on 220 MHz someplace. Other notable events were the very early Es onset of July 19 to the north and the late-night early-morning session of July 25/26. With most stations off at that hour the scope of the opening can not be determined.

73, Pat, WA5ITX

## TECHNICAL TOPICS

Q: "Does anyone have suggestions for good UHF DXing antennas suitable for indoor use? Is there some compromise such that one can improve one's reception over those little loops provided with TV sets? I have done some experimenting with a reduced size rhombic, but am not too impressed."

A: It's always difficult to get good UHF DX results with any kind of indoor antenna, unless you live in the upper part of a high-rise building, or on a hill. Of course, using a parabolic dish or large yagi inside is probably out of the question for you, but these types of antennas tend to offer the best DX performance. Your best compromise may be the stacked bow-tie antenna, such as an 8-bay (or larger) array. This type of antenna can prove to be ideal for the DXer who must use an indoor antenna to DX UHF, because it offers a fair amount of gain, and can be easily hand-rotated. It can also be easily mounted on a lamp stand, microphone stand, or any kind of home-made base you care to improvise. Several TV DXers report fair-to-good results with this type of antenna indoors, but the actual height of your apartment above ground, the amount of signal-blocking "clutter" in the surrounding neighborhood will be the most important factors --and these will vary greatly among DXers. The drawbacks of these stacked bow-tie antennas are that they tend to work best on the lower UHF TV channels, having poor gain figures up on the translator channels at ch 50 and above (although some manufacturers do offer special models cut for these frequencies), and they don't exhibit the sharp directivity patterns (i.e., deep nulls) that can be found with large yagis and parabolic dishes. For the most part, these are drawbacks you can live with, because such an antenna will far outperform the simple loop or single bow-tie usually provided with a TV set.

As far as rhombic antennas go, they do offer interesting characteristics to the DXer who likes to experiment, so don't sell them short. A well-designed (i.e., no compromise) rhombic can offer good response over the entire UHF TV band, and unlike the stacked bow-tie antenna, shows increasing gain with increasing frequency. You'll find that the stacked bow-tie antenna types are much more practical for DXing purposes though. It's almost impossible to find a commercially available rhombic for UHF TV, but it's easy to find a good 4- or 8-bay UHF antenna at a dealer. The largest of the 8-bay models stands about five feet tall, at just over two feet wide.

Well here you have the Total Political Units Standings from the 'Great 28.' Where was your report?

Just a few reminders now. All the above ties were broken by the total number of stations seen by the individual Dxers. Upcoming in the future for the column will be some NEW RECORDS set since the last All-Time records listing. Maybe you will be one of them. I know for a fact that this summer brought many long haul Es and tropo sessions. So I urge you to send in your distances that you think might qualify your reception as a record setter.

Remember to support this column and all other VUD columns and this is your club. Also, club supplies aid you in many facets of your DX hobby. These club supplies are listed on the back cover of the VUD. One publication that is a must for the TV Dixer is the UHF Translator list. If you have the equipment and the time, the use of this guide will net you TV DX totals quickly. Just write WIFDA HQ for current price and availability.

Central Texas was once again endowed with some warm, pleasant weather during the first week of November, and this produced the first 300-700 mile traps heard by this reporter in a number of months. The trop opening (albeit mediocre) was certainly welcomed since I had seen the temperature plummet to around 24 degrees at the end of October. (It was down to around 29 here then. DB)

A lot of mid-late July Es resurgence. Lots of time taken out of the July 17 events due to the 144-MHz openings. There was even a report of an almost-contact on 220 MHz. Trop was still often more of a problem as it masked some of the weaker Es and made MUF determinations difficult at best. ??

Danny Huston, 1312 N. Skyline, Stillwater, OK 74074

He here has grounded to a halt since the past month so just commenting, folks..... I recently returned from a sightseeing trip at the Kiamichi Mountains of southeast Oklahoma, a portion of a whole region called the Ouachita Mts. that extend into central Arkansas. One favorite thing to do in these parts is to take the high road called Tallman Scenic Drive as it makes its way across the forested peaks of the Winding Stair Mts. that tower 2000+ ft. above the valley floors. Plenty of turns lead to spectacular vistans. A favorite DI fantasy of mine is living in one of the bigger valley towns like Potomac or Heavener, OK (hang glider hangout) and in ownership of a DUKmobile, a van containing antennas, poles, tuners, the works. When conditions are up I'd venture up to the mountain tops and tune away. Would reception wonders ever cease? Unfortunately, Tallman Dr. is troubled by several landslides. The scariest one destroyed a 30 ft. segment from the outer lane, near a peak. Luckily, one can maneuver around without falling in. It's no bad the state may have closed the road by now. 25 miles north of Tallman Dr. lies huge Cowan Hill, looming majestically above Potomac. It's billed as the world's highest hill at 1999' above the valley, not above sea level). A sharply winding road leads to the top where there is a good many towers positioned. Among them is KMF 96.9, Potomac. At my QTH, 155 miles away, KLUU's rather heavy daytime fading often settle down enough at night to make for good stereo listening. All in all, a good trip worth repeating someday.

In an upcoming issue Consumers Reports will cover FM roof antennas!

## MORE ON TV NEWS

HOM "Tulsa 23" now on. Its 3.3 million watts doesn't cut it when showing up here, 75 miles away off a Radio Shack U-75. Show can only be tuned in color some evenings. For viewer's questions and reception reports KOMU actually has a toll free no. 800/722-3694. Don't know where all it covers or how long it will last.

The new KAUT-43 of Oklahoma City is gambling wildly with its radical departure from conventional programming and broadcasting. KAUT starts the week day at 11:30 am with news printed for the hearing impaired. At noon its Newswatch 43 with five straight hours of news and information, a concept little tried with no successful precedent. Sophisticated news gathering capability characterizes the show. From 5 to 7 pm its comes tv--Kev Griffin and Liars Club game. After 7 it's a whole new ballgame when the switch is thrown to send the signal out in coded form for subscription TV, or in other words scrambled TV. The non-subscriber is confronted with no horizontal control. Rather often the video tries to straighten up though, people become easily discernible but somewhat wavy distorted plus there is a multi-colored striped zigzag bar penetrating down the right of the picture. Actually, the scrambled TV picture has a split personality. In constant motion, it can't make up its mind what it wants to do, perhaps the TV innards are puzzled in coping with it. It's quite a mess. To salvage the channel now, one must pay dearly for the privilege-\$49.50 for installing the decoder box, \$35 deposit, \$22.50 monthly. In return, the treat is "VIU"(sic for View), a version of Home Box Office, etc. In comparison, Cable TV with HBO is quite a steal in my town. KAUT expects to offer this new fangled service within 55 miles of its 2 million watt, nearly 1600' tower. Don't see how they expect to have any takers in towns having HBO unless they're red-eyed TV freaks with 2 or 3 video recorders. 43's scrambled TV is more of an advantage rather than hindrance as far as Iiling the station is concerned. Non subscribers can hear announcements explaining what's wrong with the video along with promos. Interestingly, new KGET-41, Tulsa is considering mimicing KAUT. A new show is definately in the works. It will be interesting to see if this new kind of TV programming catches on and spreads throughout the country. Or will it be a colossal blunder?

John Ebeling - 9209 Vincent Ave. S. - Bloomington, MN 55431

Hardly any DX to report from Minnesota as far as I am concerned. No extended high pressure areas have hung around so this fall has not even produced any tropo to speak of. All in all, a disappointing past few months. Only one new "catch" for the entire month of October, and it was logged at the cabin at Prosit, MN.

10/5 1530 KSDW 94.3 MN International Falls (auto k, days)

That's it from here. Until next time I have something to report. 73's, John Ebeling

A remarkable September, eh? Well...October was even better, and November is really starting to shape up. Well, back to AW for hibernation. I can't DX FM unless I'm at the cottage anyway, as aside from three weeks in December-early January, three weeks in March-April, and occasional weekends, don't expect much till late May. I can hardly wait for a new Es season...How about another January opening. 73's, Saul

Deadline: 5th of month

### DECEMBER 1980

Incredible as it may seem the solar flux levels appear to be heading for a sizeable peak at the time of the year it will do the most good for the northern hemisphere F2. As of this writing, the flux had already peaked briefly over the 300 mark (though maybe a flare enhanced situation). That is only the 5th such day since August 1959! Also, the sun has been prolific in recent large flare production.

Consequently, while not at the levels of last year, 50-MHz DX has certainly "taken off". The most numerous N.America to Africa contacts since Cycle 19 are being made (though mostly with Liberia some have been with S.Africa and S.W.Africa). European contacts have been made as far as the midwest and MN. Transcontinental paths have become somewhat common again. Japan contacts have been made in the central US with some even heard much more to the ne. The Alaskan paths are on a rapid upswing to the US and a few 50-MHz events from there to Australia. (Again, for more details see the weekly ham radio report, monthly SMRI, quarterly SMRI newsletter, or monitor the 28.885 MHz 6-m info net.)

## How to Tape DX

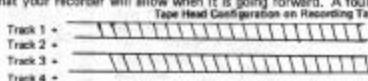

BY BRUCE F. ELVING, PH.D.

Some of the best DX that I have received came before tape entered my life. I am sure you, too, have memories of really good DX that are only that—memories, substantiated by listings of what you heard in a log or as a letter of verification of what you received. Log listings are essential, of course, for your own records and for the club's Statistics section, and verifications are nice for those who go in for QSL collecting. But the proper use of a tape recorder while DXing can do a lot to enhance your hobby. The recorder can be cassette, eight-track or reel-to-reel, monaural or stereo. While most of the specific advice will give pertains to reel-to-reel, certain principles of recording are common to all three systems.

You needn't spend a large sum on a tape recorder. Used reel-to-reel recorders are perhaps the best deal. Gadgets such as automatic reversal of tape, extra-large reel capacity, sound-on-sound, and Dolby might be nice to have, but are not necessary for recording DX. Reel tape, too, is cheap, and can often be bought at rummage sales, begged off radio stations for free, and spliced together easily by the recordist. All cassette recorders I know of have "automatic level control," which sets the recording level a certain way so that all sounds come onto the tape with the same approximate degree of loudness. This is bad for DXing, and for making off-air radio "air checks." I will discuss "air checks" later. A few cassette recorders include a switchable ALC control (such as the General Electric 3-5255 AM/FM/FM Stereo radio cassette recorder at about \$175). Another good feature on cassette recorders is an auxiliary input jack (the G-E mentioned above has such a jack). This enables high-level inputs, such as an FM tuner presents, to be recorded without distortion. Cheaper cassette recorders, with only a microphone in jack, require the use of a resistor patch cord for the tuner's audio to be properly recorded. When you go to a resistor patch cord for taping DX you introduce fidelity loss and increased hum distortion onto the tape.

A good feature to have on any tape recorder or tape deck is a cue control. This allows you to selectively stop the recorder while you are tuning for DX, with the record and audio-level controls unchanged. When the cue is released (usually a one-finger operation), your recording continues at full speed ahead (but, of course, not fast forward). Thus you don't have to firmly press the "record" and "play" buttons. A lockable cue is better than a cue that you have to hold all the time. When DX is pounding in, such as it did June 10, I don't like to record the entire eight hours or so of the DX. My desire to listen to tapes is limited; therefore, I do not usually tape while tuning across the dial, but once tuned into a station about to identify, then I let the tape roll. Otherwise, the cue holds the tape apparatus in madness. While I may tape a little of a station's music to preserve the flavor of its programming, my main interest is in taping its legal identification, usually given and required by the Federal Communications Commission, on the top of the hour (within a few minutes of that time). I may also tape commercials, beginnings of newscasts, etc., for detail to be used in writing a letter, [reception report] seeking a verification from a station.

My recorders happens to be stereo, but even if I am taping a monaural station or have the receiver turned to "mono," I record on both stereo channels. The objective is to record the maximum width of tape that your recorder will allow when it is going forward. A four-track stereo recorder will normally

record on tracks 1 and 3 of the tape. If the tape is reversed, then tracks 2 and 4 would be utilized. If you can fill both tracks 1 and 3 instead of only track 1 or track 3, your tape will usually be recorded at a higher audio level and be less susceptible to "drop out" because of aberrations in one of the tape tracks. Therefore, I use two patch cords between my receiver or tuner and the tape recorder.

Now, for the most important tips to follow. Only record on one side of a tape. Never reverse tape. Have plenty of tape on hand so that when DX is pounding in you can go to a new reel or a new cassette. Do not waste time rewinding tape when DX is heard. You can get perfect recordings of DX with just one tape recorder; you don't need a second one in readiness for when the tape ends on the first recorder. Just put aside the tapes that have made their one-way excursion through the recorder, grab a new tape, transfer the used reel to the take-up side of the machine, and you are ready for more exciting taping! Remember, to minimize tape handling, use long tapes, if possible. A long tape for reel-to-reel would generally be on a 7-inch reel, and for that you need a 7-inch takeup reel. If you happen to be using a 5-inch tape, wind the 5-inch tape onto a 5-inch takeup reel. You will need all the take-up reel capacity you can have when DX is coming in, and if the tape you are about to use is on a 7-inch reel and the only clear reel you have is a 5-inch you are headed for trouble! Later on you can do the tape rewinding. No matter how selectively you do your recording, however, after you listen to the tapes, you will discover a lot of "garbage" that you wouldn't care to hear again, including something my wife, Carol, calls "static." All of this you will want to edit out if you want to keep the good stuff—such as IDs of rare DX.

Do your DX taping at 7½ inches per second! The high speed is on your recorder to permit you to record with better fidelity than is possible at 3½ ips, 1 7/8 ips, or even 15/16 inches per second. True, recording at 7½ ips uses up tape at twice the rate that recording at 3½ ips does, but the fidelity is so much better that it is definitely worth it. When you record at the faster speed, you can go back and pick out an ID or other program details from the mush than would be possible if recorded at a lower-fidelity slower speed.

An even better reason for using 7½ inches per second is that you might want to go through your tapes and edit out the garbage, saving only the IDs and other good stuff. You could take tape splicer in hand and razor blade and splice all that stuff out, but that is a laborious process, and it results in a bunch of spliced tape stock for you. The best way is electronic editing, using two reel-to-reel (or cassette to reel-to-reel) editing, where you save only the good material on the tape. To do good cuts, as this process is called, requires tapes that were recorded with as good a quality as possible in the first place, hence the need for 7½ ips exclusively when taping for DX purposes. Then the tape you had the DX on originally can be erased and used again. The best erasing is with a bulk tape eraser. This is by far the best method of clearing cassettes and eight-track cartridges, as well as reel tapes of all previous material from all tracks simultaneously. An el-cheapo model is listed in the McGee Radio Co. catalog (1901 McGee Street, Kansas City MO 64108) at \$26.95. We have been using it at V-81 radio, and find that it has a cheap switch which had to be replaced with a heavier-duty momentary switch that the one it came with.

Many people mail DX tapes to me, and not only do they send material at 3½ ips or 1 7/8 ips, it includes a lot of songs and extraneous programming. When you mail a tape to a fellow DXer or to a radio station along with your reception report, send only an "air check." Never, unless you have a definite reason for doing so, include entire musical selections. When you sense that a song is ending, start your recorder, tape all of the announcer's chatter between records, and then stop the tape after the intro to the next song is said. If commercials are similarly deleted, you could present the flavor of an entire hour's programming on a radio station in as little as two to three minutes. By selectively editing what you mail on you can use 7½ inches per second with all its fidelity advantages, and still not have to send a long tape, probably a 5-inch tape at the maximum would be sufficient. Little 2½" to 3" tape reels do not play on "professional" machines found at radio stations, so be careful about sending tapes like that if you want a station engineer or manager to hear his or her station as you received it. Be sure, too, that the tape you are sending has been bulk erased, or is a new tape, so that nothing else on tracks you have not recorded on. Some stations utilize full-track monaural recorders, and anything else on your tape could be heard in backwards rendition along with what you intended the folks in "radio land" to listen to.

Most radio stations and fellow DXers now have access to cassette recorders, and here it is better to use quality tape, especially in the C-60 mode and longer, that won't bunch up around the tape cartridge. For tape dubbing, I have found that dubbing from reel-to-reel onto cassette results in better quality than when you record from cassette to cassette. But most of my experience with cassettes has been with lower-priced units, and it is possible that with better component-quality stereo cassette equipment, results could be close to what you might expect with reel-to-reel equipment at 3½ inches per second. Tape is a lot of fun, and can add much to a DXers enjoyment of the hobby. Use it well, and I'm sure you will enjoy going back over past DX, especially during the winter months like now when there might not be too much new DX to hear. Furthermore, when you have guests over, you might make some converts to DXing by playing them evidences of your "strange" hobby!

[The author offers copies of his Duluth, Minnesota, DXing, on an FM DX tape, containing almost 100 FM station identifications, with examples of sporadic-E skip, tropospheric DX, and meteor scatter, for \$1.00 from Box 261-KSC, Kearney NE 68847. That tape is at 7½ inches per second, full-track monaural, reel-to-reel.]

# MORE ABOUT CAR FM FILTERS

BY PETER WEEKS

This is a sequel to the article (published February, 1980 YUD) regarding car FM filters.

Fundamentally, this was a set of experiments to deal with overloading problems caused by 5 high-powered FM stations radiating from the CN Tower (1/2 mile high) about 4 miles from here. Reception of certain Buffalo stations (across Lake Ontario, about 80 miles or so away) was greatly helped by a couple of simple LC filters connected across the antenna lead and ground a few inches from the receiver input, thus:

Tuning this to the minimum interference point for the strongest offending station also reduced interference from other stations that might also be audible at that point on the dial.

But one problem with this is that a given setting affects reception of other stations near the point of resonance. In other words, there is a noticeable "insertion loss", for example, when this filter is tuned to 104.5 MHz to eliminate CHUM-FM Toronto, in order to clear up interference with WNEO-FM Buffalo at 94.5, there would be some loss of the desired signal. I did mention compromises which would weaken the effect of the filter, while still enabling it to do the necessary job. But I am wondering still if someone can come up with any of the following improvements-- to make it a narrower-band filter with a sharper resonance curve:

- (a) using an "active filter", although what I have read seems to indicate that they are the most suitable and successful at much lower frequency ranges, particularly at audio ones (as in equalizers),
- (b) a multi-stage passive filter for more selectivity,
- (c) a multistage filter that would allow for filtering of 2 or 3 specific frequencies at the same time.

Are RC filters rather than LC filters the way to go here?

With my new car, a Datsun 520 with a Clarion AM-FM mono set, I have far fewer problems with overloading, such that simple filters are adequate most of the time, if they are needed at all. But I have noted considerable success with an FM booster sold by HARMONICS (65 Moul Road, Hilton, NY 14468), model PL4, a VHF preamp. Unlike most, this is a TUNED circuit

## MORE ABOUT CAR FM FILTERS

which is about all that could work in this location. The range for which it is designed is rather narrow, but by attaching knobs to plastic screw-drivers for tuning the coil slugs, I can conveniently cover from 88 MHz to just over 92 MHz, ideal for the educational FM section of the band, and particularly the station I wanted to receive more clearly for their jazz broadcasts, WEDO Buffalo, whose power is only 21,500 watts. The gain is quite impressive, and has enabled some good DX--from such stations as WUOM Ann Arbor, MI, WVO Oswego, NY, WYSU Youngstown, OH, WKSU Kent State University, OH, WQED Pittsburgh, PA, and WQLN Erie PA on the adjacent channel to our local CNTR, a 50 kw at 91.1. This booster with its tuned circuit serves to assist the filtering out of the CN Tower stations further up the band starting at 94.1 MHz. Is anyone familiar with other TUNED FM boosters which could cover the whole band, or adapting fixed ones like Winegard's for locations where overload is a problem?

If anyone wants further details about the switching and by-pass circuits that I use for the combination of the booster and filters, I'd be glad to oblige.

## TECHNICAL TOPICS (continued from page 13)

Q: I read that when you stack antennas, you should use only a "hybrid" type combiner. What is a hybrid combiner?

A: Hybrid combiners (also called splitters, or splitter/combiners) are coupling devices that allow signals to go in one direction only. When a hybrid splitter/combiner is used as a combiner, the output of the combiner contains the sum of the two input signals, while the signals remain effectively isolated from one another. If you're stacking antennas for best DX performance, make sure you use a good quality hybrid-type combiner. They are more expensive than resistive-type combiners, but cause much less loss of signal. The most important thing about the hybrid combiner is that it allows the signals from the antennas in a stack to add together in such a way that a very deep signal null can be created in certain directions. Other cheaper types of splitter/combiners can't do this, because they don't offer the high amount of isolation between input signals that hybrids do.

Q: "Stacking antennas will give increased signal gain, but isn't it easier to just get a preamp--to give the same results?"

A: When antennas are stacked for DXing purposes, it's not so much for the increased gain. After all, stacking two identical antennas produces only 3 db signal gain, which would hardly seem enough to justify the cost of a second identical antenna to many DXers. The real value of such an array comes in the deeper nulls that are created, such as in the case of a horizontal stack. The gain that a preamp gives you, and the increased gain of a stacked antenna array are really two different types of gain, even though they can both be expressed in dB. A preamp won't be of much use unless its noise figure is lower than that of your tuner--and even then it may be overloaded by strong local signals. A good antenna stack, on the other hand, will give you many more DX opportunities than you would have had without it, because along with the gain increase comes increased directivity. This improvement in DX system performance is usually more important on the FM and highband VHF TV bands, where it can be of use in "digging" weak signals out of a crowded channel during an intense tropo opening. Stacking antennas for DXing is rarely easy--and almost never very cheap--but is probably the best way to add new stations to your log on the high-band VHF TV and FM channels.

# 1980 WTFDA

# CONVENTION REPORT

The first weekend of August, 1980 brought 30 avid VHF-DX enthusiasts to the Dunkirk, NY area for the twelfth annual WTFDA convention. The gathering was hosted by veteran TV DXer Bob Seybold at the Seybold family farm, with accommodations nearby at the Vineyard Motel.

The first arrivals on Friday (August 1st) evening were treated with transmissions up to Bob's Hilltop DX location, several miles away (and several hundred feet higher) from the Seybold farm, a location where 300-400 mile DX is present with fair-to-excellent signals on the simplest of DX equipment on the average summer evening. Meanwhile, down at the Seybold family farm, DX "gab" sessions were getting underway as the evening progressed. As the ranks of arriving DXers grew, plenty of refreshments were consumed as signs of a slight tropo evening were detected.

Things got into full swing Saturday (August 2nd) morning. As rain came to Dunkirk that morning (oh, well--it was good for the grape crop!), signs of building tropo diminished. At the same time however, Eskip was noted by several DXers--first on the F-meter (50 MHz) amateur radio band, and then into VHF channels 2 and 3 for a brief period.

The later part of that morning saw the first of several equipment demonstrations, the most fascinating of which was Jerry Police's. Jerry had brought along his VHS-format VCR and displayed tapes of his astounding reception of British and European video signals via F2 during the winter '79-'80 DX season. Jerry had assembled a fascinating collection of video images of actual real-time F2 opening. The amazed attendees got to see what a 3000-mile-plus skip opening looks like, complete with the fading and smearing patterns that are characteristic of this exotic DX mode.

Massachusetts DXer Bill Grant displayed his European standard TV receiver, and showed us what the North American local signals looked like when viewed on a set with different video standards. Needless to say, it wasn't very useful for domestic TV DXing, but during the F2 skip season, you could have viewed European video with its built-in antennas!

Following the demonstrations and some informal talks, the group moved to the Vineyard for the traditional banquet.

The meal was followed by a brief talk and "Q and A" session by engineer Joe Gragg. It seems like Joe's technical talks are fast becoming one of the highlights of WTFDA conventions, as there were plenty of questions for him from the attendees--and Joe enlightened us on everything from mediumwave propagation to galactic noise levels.

After Joe's "chalk talk," it was time to return to the farm's DX site in the Seybold barn, where more informal talks were given. F2 skip DX was a big subject with many of the conventioners, with a lot of information exchanged about possible DX targets in Europe in F2 range of North America.

There was plenty of time to check DX equipment and also plenty of time for more DX gab sessions. As the evening went on, several more DXers went up to "The Hill," to see what conditions are like up there "between" openings (the 300-400 mile DX seems to hang in there, even during rain!)

Sunday morning started early (too early for some DXers), with the club business meeting. The state of the club, and its future, was discussed, along with printing problems, and suggested projects, as well as staff changes. Major announcements centered around staff changes, with Jim Alexander taking over as club Bookkeeper on a temporary basis, and the closing of the old Deerfield, IL club address.

At the close of the meeting, the formal part of the convention was over, with the drawing for door prizes. Among the lucky winners were Ontario DXer Mike Reid (Windguard AC-1990 UHF preamp, donated by Bob Seybold) and Illinois' Steve Shaffer (Archer V-100 VHF antenna, donated by WTFDA).

WTFDA is grateful to Bob Seybold for another fine job as convention host. We'd like to thank all who attended, and those who assisted Bob. See you at next year's convention!
